

**AMENDMENTS TO THE CLAIMS**

1. (Currently Amended) A printing module which comprises~~provided~~ with an impression roller, a plate cylinder assembly comprising~~containing~~ a plate cylinder which is provided with a print image and which, in use, with the interposition of a substrate to be printed, abuts against the impression roller, an anilox roller and a doctor roller, the doctor roller taking up ink from an ink reservoir, the anilox roller being arranged between the doctor roller and the plate cylinder~~[,]~~ such that a desired amount of ink is taken off~~removed~~ from the doctor roller by the anilox roller and transferred to the plate cylinder, the position of the plate cylinder being settable, the position of the anilox roller being settable, and the impression roller being rotatably bearing-mounted in a main frame, characterized in that wherein the plate cylinder is rotatably bearing-mounted in a first subframe which is movably connected with the main frame for the purpose of the positioning of the plate cylinder relative to the impression roller, while~~and~~ the anilox roller and the doctor roller are rotatably bearing-mounted in a second subframe which is movably connected with the main frame for the purpose of the positioning of the anilox roller relative to the plate cylinder, said movable connections being so designed~~such~~ that a positioning change of the plate cylinder relative to the impression roller does not affect the positioning of the anilox roller relative to the plate cylinder and that a positioning change of the anilox roller relative to the plate cylinder does not affect the positioning of the plate cylinder relative to the impression roller.

2. (Currently Amended) [[A]]The printing module according to claim 1, wherein the plate cylinder assembly is provided with a stop surface, the second subframe being provided with a stop which, in use, abuts against the stop surface of the plate cylinder.
3. (Currently Amended) [[A]]The printing module according to claim 2, wherein the position of the stop of the second subframe relative to the second subframe is settable.
4. (Currently Amended) [[A]]The printing module according to claim 2, wherein the position of the stop surface on the plate cylinder assembly relative to the plate cylinder assembly is settable.
5. (Currently Amended) [[A]]The printing module according to claim 1, wherein the movable connection between the second subframe and the main frame is realized via a movable connection between the second subframe and the first subframe.
6. (Currently Amended) [[A]]The printing module according to claim 1, wherein the movable connection between the first subframe and the main frame is a connection pivotable about a first pivot.
7. (Currently Amended) [[A]]The printing module according to claim 5, wherein the movable connection between the second subframe and the first subframe is a connection pivotable about a second pivot.

8. (Currently Amended) [[A]]The printing module according to claim 1, wherein the movable connection between the second subframe and the main frame is a connection pivotable about a second pivot connected with the main frame.
9. (Currently Amended) [[A]]The printing module according to claim 1, provided with a first piston-cylinder assembly which has a first end connected with the main frame and which has a second end connected with the first movable subframe, such that with the aid of the first piston-cylinder assembly the pressure which the plate cylinder exerts in use on the impression roller is settable.
10. (Currently Amended) [[A]]The printing module according to claim 1, provided with a second piston-cylinder assembly which has a first end connected with the main frame and which has a second end connected with or abutting against the second subframe, such that with the aid of the second piston-cylinder assembly, the second subframe is adjustable relative to the main frame.
11. (Currently Amended) [[A]]The printing module according to claim 2, provided with a second piston-cylinder assembly which has a first end connected with the first subframe and which has a second end connected with or abutting against the second subframe, such that with the aid of the second piston-cylinder assembly, the second subframe is adjustable relative to the first subframe.

12. (Currently Amended) [[A]]The printing module according to claim 1, wherein the plate cylinder assembly is provided with a stationary shaft on which the plate cylinder is rotatably bearing-mounted, while on opposite sides of the plate cylinder a stop ring is provided which forms the stop surface and is fixedly connected with the stationary shaft, while on opposite sides of the plate cylinder a supporting ring is fixedly connected with the stationary shaft.
13. (Currently Amended) [[A]]The printing module according to claim 12, wherein the first subframe comprises two receiving units disposed on opposite sides of the plate cylinder, in which receiving units rest the supporting rings when the plate cylinder assembly in the operative position is mounted in the printing module.
14. (Currently Amended) [[A]]The printing module according to claim 13, wherein the receiving units are each provided with a supporting surface which is provided with a particular curve, the curve being such that the distance between plate cylinder and the anilox roller on the one hand and the distance between the plate cylinder and the impression roller on the other in each case remain pairwise equal to each other at different diameters of plate cylinders, which are provided with supporting rings of diameters matching the plate cylinders.
15. (Currently Amended) [[A]]The printing module according to claim 13, wherein fixation means are provided for fixating a plate cylinder assembly in the receiving units, the fixation means being located substantially under the plate cylinder assembly.

16. (Currently Amended) [[A]]The printing module according to claim 15, wherein the fixation means comprise two rods which, at an upwardly directed end, are provided with a hook, the two hooks engaging, on opposite sides of the plate cylinder, the stationary shaft of the plate cylinder assembly when the plate cylinder assembly is in the operative position, while on the two rods a pull force is exerted for pressing the plate cylinder assembly into the receiving units.

17. (Currently Amended) [[A]]The printing module according to claim 16, wherein the two rods, at the ends remote from the hooks, are each connected with a piston-cylinder assembly for adjusting the position of the rods in a longitudinal direction thereof and for exerting said pull force.

18. (Currently Amended) [[A]]The printing module according to claim 15, wherein the fixation means are further provided with bearing surfaces on which rests the plate cylinder assembly when the fixation means are in a release position, while the plate cylinder assembly in this release position is lifted out of the receiving units and is moved upwards, such that the plate cylinder assembly can be simply taken out of the printing module.

19. (Currently Amended) [[A]]The printing module according to claim 16, wherein each rod is provided with a said bearing surface, which bearing surface upon upward movement of the rods in the direction of the longitudinal axes of the rods automatically enters into engagement with the stationary shaft and thereby lifts the plate cylinder assembly from the receiving units.

20. (Currently Amended) [[A]]The printing module according to claim 15, wherein substantially above the receiving units receiving means are provided for mounting additional processing means.

21. (Currently Amended) [[A]]The printing module according to claim 20, wherein the receiving means comprise two guides.

22. (Currently Amended) [[A]]The printing module according to claim 20, wherein the additional processing means comprise, for instance, substrate web inverting units, winders, on laminating units-or the like.

23. (Currently Amended) A printing machine provided withcontaining a printing module according to claim 1 which comprises an impression roller, a plate cylinder assembly containing a plate cylinder which is provided with a print image and which, in use, with the interposition of a substrate to be printed, abuts against the impression roller, an anilox roller and a doctor roller, the doctor roller taking up ink from an ink reservoir, the anilox roller being arranged between the doctor roller and the plate cylinder such that a desired amount of ink is removed from the doctor roller by the anilox roller and transferred to the plate cylinder, the position of the plate cylinder being settable, the position of the anilox roller being settable, and the impression roller being rotatably bearing-mounted in a main frame, wherein the plate cylinder is rotatably bearing-mounted in a first subframe which is movably connected with the main frame for the purpose of

the positioning of the plate cylinder relative to the impression roller, and the anilox roller and the doctor roller are rotatably bearing-mounted in a second subframe which is movably connected with the main frame for the purpose of the positioning of the anilox roller relative to the plate cylinder, said movable connections being such that a positioning change of the plate cylinder relative to the impression roller does not affect the positioning of the anilox roller relative to the plate cylinder and that a positioning change of the anilox roller relative to the plate cylinder does not affect the positioning of the plate cylinder relative to the impression roller.
